

Azure OpenAI vs Document Intelligence: la battaglia dell'estrazione dati!!!!

Massimo Bonanni

Thanks to

AZURE DAY

Data extraction from document

Extracting data from documents is a common scenario in many business processes like finance, legal, healthcare, and many others, where decision-making often depends on the information contained within various documents.

Involving the conversion of unstructured, semi-structured or structured document into a structured data.

AZURE DAY

Technologies and Tools

OCR Technology

For converting images of text into machine-encoded text. Advanced OCR solutions can handle complex layouts and even handwritten text.

Natural Language Processing (NLP)

For understanding the context of the extracted text, identifying entities, and classifying them appropriately.

Machine Learning and Artificial Intelligence

For improving the accuracy of data extraction over time, learning from corrections and adjustments made during the post-processing phase.

AZURE DAY

Challenges

Different Document Formats

Document formats like PDFs, Word files, scans, and handwritten notes each need tailored methods for data extraction, adding complexity to the process.

Poor Document Quality

Quality issues like low resolution, skewing, noise, and distortions in scanned documents can impair OCR accuracy, resulting in data extraction errors.

Complex Document Layouts

Extracting data from documents with complex layouts like tables and graphs is challenging and prone to errors, necessitating sophisticated processing techniques.

Unstructured Data

Unstructured documents lack of format complicates data extraction, with NLP and ML offering solutions that demand considerable training data and advanced algorithms for context and semantics.

AZURE DAY

Document Intelligence

Custom Model

AZURE DAY

What is Document Intelligence?

Azure Document Intelligence is a cloud-based service that uses **machine learning** to automate the extraction of **text** and **structure** from documents.

Azure Document Intelligence **can be deployed in the cloud or at the edge**, and integrated with other Azure services for data processing, search, and analytics.

It is a powerful tool for enhancing data-driven strategies and enriching document search capabilities.

AZURE DAY

Document Intelligence Key Features

It can handle various types of documents, such as **Pdf, Images** or **Office documents** (only few models) composed by multiple pages

It offers **prebuilt models** for common scenarios (IDs, receipts, invoices, contracts) as well as custom models for specific document types

It allows users to **customize the extraction** process by training on their own data with minimal effort

It supports both **printed** and **handwritten** text, and provides built-in security and privacy for data and models

AZURE DAY

Models Overview

Pretrained document-analysis models

Read OCR model

Layout analysis model

Layout analysis model with KeyValueCollection option

Pretrained scenario-specific models

Pretrained models for specific scenario like US tax document, contract, invoice and so on

Custom models

Extraction Models

Classification Models

AZURE DAY

Custom extraction models

Neural Model

Best for **semi-structured** and **unstructured** documents to extract fields

Supports a subset of the field types supported by custom template models

Template Model

Is an easy-to-train document model that accurately extracts labeled key-value pairs, selection marks, tables, regions, and signatures from documents

Extracts fields from **structured** documents with defined visual templates.

Composed Models

A composed model **combines multiple custom models** into a single model. When a document is submitted for analysis using a composed model, the service performs a **classification** to determine which custom model best represents the document.

AZURE DAY

Document Intelligence Studio

Online tool for Document Intelligence service.

Learn, test, experiment, models and features with **your own** or sample documents.

Train custom models for classification and extraction.

Get sample code for different languages.

AZURE DAY

Azure OpenAI

GPT-4 Turbo Vision

AZURE DAY

What is Azure OpenAI?

Azure OpenAI is a cloud-based platform that offers access to various **OpenAI models**.

The service supports the latest OpenAI models such as GPT-4, GPT-4 Turbo with Vision, **GTP-4o**, GPT-3.5-Turbo, and Embeddings.

The service can be accessed through REST APIs, Python/C# SDK, or the web-based interface in the **Azure OpenAI Studio**.

AZURE DAY

GPT-4o (“o” for “omni”)

It accepts as input any combination of **text, audio, image, and video** and generates any combination of **text, audio, and image** outputs.

It can respond to audio inputs in as little as **232 milliseconds**, with an average of 320 milliseconds, which is like human response time.

It matches GPT-4 Turbo performance on text in English and code, with significant **improvement on text in non-English languages**.

AZURE DAY

GPT-4o vs GTP-4 : Voice Mode

Prior to GPT-4o, you could use **Voice Mode** to talk to ChatGPT with latencies of **2.8 seconds** (GPT-3.5) and **5.4 seconds** (GPT-4) on average.

GPT-4o is a **single new model** end-to-end across text, vision, and audio, meaning that all inputs and outputs are processed by the **same neural network**.

Extract Data with Prompt Engineering

Prompt Engineering is a technique that leverages **natural language processing** and artificial intelligence to create effective prompts for various tasks and domains.

A **prompt** is a text input that guides an AI model to produce a desired output, such as a summary, a classification, a translation, or a generation.

One of the applications of Prompt Engineering is to **extract data from texts and documents**, such as names, dates, locations, keywords, sentiments, etc.

Extract Data with Prompt Engineering

Session Feedback Form

Event Name: GLOBAL AI BOOTCAMP

Session Code: Session 1

How useful did you think this event was for you?
(please check the appropriate number where 1=not at all useful and 5=extremely useful)

1	2	3	4	5
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

How would you rate the session?
(please check the appropriate number where 1=not at all useful and 5=extremely useful)

1	2	3	4	5
<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Do you agree that the speaker was prepared about the topic of the session?
(please check the appropriate number where 1=not at all useful and 5=extremely useful)

1
<input type="checkbox"/>

Comment:
Amazing

Analyze the image and extract the information about feedback in the following JSON format:

```
{
  "EventName": "",
  "SessionCode": "",
  "EventQuality": 1,
  "SessionQuality": 2,
  "SpeakerQuality": 5,
  "Comment": ""
}
```

The EventQuality field is an integer value from 1 to 5 and it is represented by the checked square in the second row of the first table: starting from the left, if the first square is checked then the value is 1; if the second square is checked then the value is 2; if the third square is checked then the value is 3; if the fourth square is checked then the value is 4; If the fifth square is checked then the value is 5. if you don't find any checked squares in the row, set the value 0.

.....
If you are not able to extract data, put the string "<error>" in the field.
If you are not able to extract the entire set of data, return empty string.

```
{
```

In a GPT prompt, you would use:

- **primary** to direct the main focus of the conversation,
- **supporting** to add detail and nuance,
- **grounding** to ensure that the response is well-informed and relevant to the topic.

Primary

Supporting

Grounding

AZURE DAY

Pricing

Models	Context	Input (Per 1,000 tokens)	Output (Per 1,000 tokens)
			
GPT-4o Regional API	128K	€0.0047	€0.0139

The number of tokens you spend in the GTP-4o calls depends on the images, audios and videos size you are using.

AZURE DAY

Conclusions

Document Intelligence supports PDF and DOCX files up to 2000 pages and run on containers

GPT-4o can extract data from unstructured documents

You can orchestrate both calling Document Intelligence first and GPT-4o after to refine data.

AZURE DAY

Thank you!

Vote my session
